

Enterprise Mobile Applications

It is no longer a question of “if” enterprise applications will need to be mobility enabled, but how far behind you may already be. According to CIO magazine, “two-thirds (65 percent) said they will deploy five or more mobile apps this year. Another 21 percent are deploying 20 or more mobile apps.”

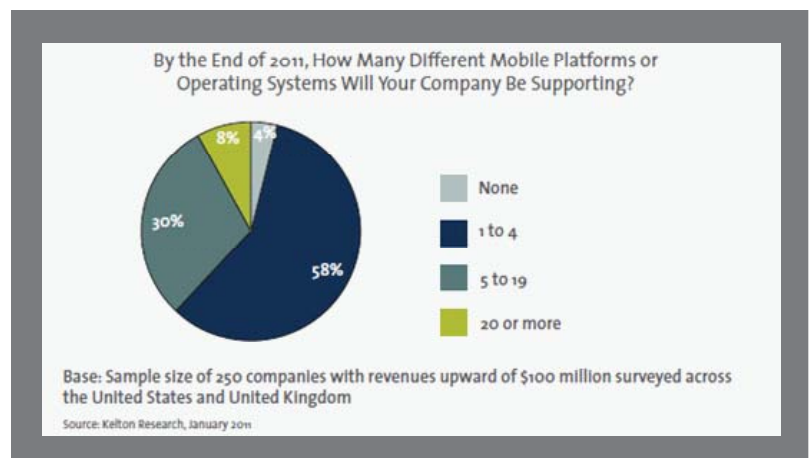

The rich capabilities, intuitive interface and price/performance that smartphones and, in particular, tablets provide mobile professionals has made these devices preferred substitutes to traditional mobile PCs.

Already overburdened enterprise IT organizations now have to scramble to develop mobile versions of their key business software, as well as develop new applications to retain and attract customers.

However, unlike the traditional PC where Windows is the dominant OS, mobile devices are far more varied; iOS, Android, Windows Mobile and WebOS. The platform-diversity issues that have plagued core systems, has now moved out to the edge. Lack of time and available resources have made outsourcing mobile application services a virtual necessity for enterprises.

Managed Business Solutions
